The angle formed by the intersection of 2 tangents, 2 secants or 1 tangent and 1 secant outside the circle equals half the difference of the intercepted arcs! Therefore to find this angle (angle K in the examples below), all that you have to do is take the far intercepted arc and near the smaller

line and Arc

In the case of a pentagon, the interior angles have a measure of $(5-2) \cdot 180/5 = 108^\circ$. Therefore, each inscribed angle creates an arc of 216° . Use the inscribed angle formula and the formula for the angle of a tangent and a secant to arrive at the angles. $m\angle BDE = 72^\circ$.

in the interior of form a minor arc of the circl.

The measure of a minor arc is defined to be the measure of its central angle. The measure of a major arc is defined as the difference between 360 and the measure of its associated minor arc. If the endpoints of an arc are the endpoints of a diameter, then the arc is a semicircle.

Section 10.1

Tangents to Circles

The following theorem is about related central angles, chords, and arcs. It says, for example, that if two central angles in a circle are congruent, then so are the two chords and two arcs that the angles intercept. You will prove Theorem 12-4 in Exercises 23, 24, and 35.

RB is tangent to a circle. Tangent means that it just touches the outside of the circle right there at only one point. And it's actually perpendicular to the radius at that point. So this is the radius of that point. The center is at A. This is a radius. And it's tangent at point B, so it's perpendicular to the radius at that point.
